

# AI360 is operational, current and easier to use

Management update on production assurance, Tools & Kits, Library, Media Studio, responsive experience and workspace branding. Prepared 20 August 2026.

## PRODUCTION HEALTHY

The production environment is operational, the data layer is current and the latest product work has passed the complete automated quality suite and production compilation.

### Management view

The product foundation is stable and the user experience is becoming more guided, inclusive and outcome-focused.

**355/355**

#### AUTOMATED CHECKS

Complete suite passed today

**59/59**

#### PRODUCTION CHECKS

Live routes and safeguards passed

**22/22**

#### MIGRATIONS

Production schema is current

**37**

#### PROTECTED TABLES

RLS enabled across the data layer

### EXECUTIVE SUMMARY

Today's work strengthened the complete AI360 user journey. People can now discover a suitable guided workflow in Tools & Kits, complete the work privately inside a Project, find every outcome again through Library, create and manage media in a cleaner gallery, and apply their own brand context to reusable exports.

The product direction is intentionally moving from feature discovery to outcome discovery. Instead of expecting people to understand models, agents or prompts, AI360 begins with familiar needs such as preparing for an exam, improving a CV, planning a final-year project, choosing a career path, creating a campaign or checking a business name.

#### Discover

Tools & Kits presents clear starting points in the language people already use.

#### Complete

Every choice opens a real Project workflow with the selected purpose already carried into the brief.

#### Return

Library keeps documents, media and project outcomes searchable across the workspace.

# Guided entry points for real user needs

The module is now named Tools & Kits because it accurately communicates what is available today: practical AI360 tools and guided kits that help a person begin useful work. The word Market is being reserved for a future creator commerce layer, keeping the current promise simple and trustworthy.

WHY THIS PRODUCT DECISION MATTERS

| Reason                         | What changed                                                                                                | User and business value                     |
|--------------------------------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| Reduces the blank-page problem | People choose a recognisable goal instead of deciding which model, prompt or agent to use.                  | Faster time to first useful result          |
| Guides without overwhelming    | Each kit asks only for context that changes the work and then continues inside a private Project.           | Higher confidence and completion            |
| Broadens the audience          | Study, career, creative, decision and business needs sit together in one balanced catalogue.                | AI360 feels relevant beyond business owners |
| Keeps every promise functional | All 17 listings map to one of 11 working Project engines and carry the chosen purpose into the brief.       | No decorative or dead-end listings          |
| Creates a growth foundation    | The same discovery structure can later support reviewed creator-made agents, prompt packs and simple tools. | A clear path to community participation     |

AUDIENCE COVERAGE

**Study & school**  
Exam preparation, assignment research, scholarship support and final-year project planning.

**Career**  
CV and cover letter support, interview preparation, career direction and first-90-days planning.

**Create**  
Portfolio project planning and a month of usable content.

**Business**  
Business launch, naming and domain checks, marketing, ads and pitch preparation.

## The UX now supports the decision

- The page uses the full workspace width and scales from four columns to a single mobile column.
- Search now uses the direct label 'Search tools and kits' instead of repeating the hero question.
- A compact discovery bar stays available on wide screens and returns to normal page flow on smaller devices.
- Eleven workflow-specific icon families help people scan by purpose rather than seeing the same category symbol repeatedly.
- The new hero, 'Pick a useful starting point', positions AI360 as a guide rather than a catalogue of technical features.

# Changes across the workspace and why they matter

The supporting modules were improved around the same principle: users should understand where work begins, where it continues and where it can be found again.

| Area           | Change completed                                                                                                                                         | Why it matters                                                             |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| Library        | Search and combined filters across documents, images, video and Project work; responsive card layouts for laptop and phone.                              | Makes AI360 a lasting workspace rather than a one-session assistant.       |
| Media Studio   | Four-item desktop shelves now fill the row; portrait, square and landscape work share consistent previews; responsive two-column and one-column layouts. | Media is easier to scan and card actions stay close to the work.           |
| Projects       | A Tools & Kits selection now opens the matching working engine with the user's chosen intent already inserted into the brief.                            | Removes repeated setup and preserves the reason the user selected the kit. |
| Brand settings | Workspace logo and knowledge support, bounded private context, stronger file validation and brand-aware document exports.                                | Finished work can reflect the organisation that created it.                |
| Navigation     | Library and Tools & Kits are distinct destinations on desktop and mobile, with clearer labels and updated icons.                                         | People can distinguish work they own from workflows they can start.        |
| Responsive UX  | Touch targets, horizontal category navigation and layouts now adapt deliberately from wide laptops to mobile phones.                                     | The primary experience matches the devices most users use to check work.   |

## THE CONNECTED PRODUCT LOOP

**The result is a clearer AI360: start with a goal, build with guidance, and keep the outcome.**

# Operational foundation confirmed

The production environment and release foundation were checked end to end. The current system is operating normally, the database is current and application safeguards remain active.

| Control area        | Verified status           | Management interpretation                                                                                        |
|---------------------|---------------------------|------------------------------------------------------------------------------------------------------------------|
| Production routes   | 59 of 59 checks passed    | Health, readiness, application pages, security headers and discovery files responded as expected.                |
| Automated quality   | 355 of 355 tests passed   | Core chat, projects, documents, billing, media, Library, Tools & Kits, brand and security contracts are covered. |
| Production build    | Compiled successfully     | Next.js, TypeScript, route generation and final optimisation completed successfully.                             |
| Database migrations | 22 of 22 applied          | The production migration ledger is complete through 0022 with matching checksums.                                |
| Database protection | 37 tables protected       | Row-level security is enabled throughout the application data layer.                                             |
| Browser role access | No anonymous table grants | Application data remains behind the intended server and workspace access boundaries.                             |

## WHAT PRODUCTION CONFIDENCE MEANS HERE

### Data is current

Every available migration is represented in the production ledger and the schema verification completed successfully.

### Access is controlled

Workspace data boundaries, row-level protection and browser-role restrictions remain in place.

### The release compiles

The complete application passes TypeScript and the optimised production build process.

## Release discipline

AI360 now has a repeatable verification path covering automated behaviour, production compilation, live route checks, database migration integrity and workspace data protections. This gives management a consistent basis for reviewing each product update.

# Why AI360 is adopting this model

The current product direction is guided assistance around outcomes. This approach fits AI360's audience because it reduces technical decision-making while still giving users control over the context, review and final result.

| Adoption principle                          | How it appears in the product                                                                       |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------|
| From features to outcomes                   | Lead with tasks people recognise, then select the right engine behind the scenes.                   |
| From one-off answers to Projects            | Keep context, chats, files, drafts and outputs together for work that lasts.                        |
| From scattered outputs to Library           | Make everything created across AI360 easy to find and reuse.                                        |
| From business-only language to broad access | Serve students, graduates, young professionals, creators and business owners in the same workspace. |
| From generic output to branded work         | Use workspace knowledge and visual identity to make documents more useful to organisations.         |
| From a storefront label to Tools & Kits     | Communicate immediate usefulness now while keeping creator commerce as a distinct future layer.     |

RECOMMENDED NEXT FOCUS

Measure discovery

Track which categories, searches and kits lead to completed Projects so the catalogue reflects real demand.

Improve first outcomes

Use completion and revision patterns to strengthen the questions and deliverables inside the most-used kits.

Deepen Library value

Add reliable sorting and lightweight organisation as user work grows, while keeping mobile retrieval fast.

Prepare community standards

Define review, permissions, quality and earnings rules before introducing creator-made products.

Management takeaway

**AI360 has a healthy production foundation and a clearer product model. Tools & Kits makes the system easier to enter, Projects make the work durable, Library makes it retrievable, and responsive design makes the experience practical on the devices people use most.**
