

EXPRESSPAY SANDBOX INTEGRATION

Request for IP allowlist support

From AI360 Lab, Accra Innovation Center, to ExpressPay Integrations / Service Care. We are preparing a controlled sandbox verification before enabling customer billing.

CURRENT RESULT	BLOCKED BY PROVIDER IP POLICY
Credentialed Submit API probe	ExpressPay returned status 4: Invalid IP. The request reached the documented sandbox Submit endpoint, but the caller IP is not authorized.

Support requested

1. Please confirm that IP allowlisting is required for this sandbox merchant and advise the secure channel for submitting our stable staging-server egress IP.
2. After we submit that IP, please authorize it for the sandbox Submit and Query APIs.
3. Please provide the approved sandbox card and Mobile Money testing instructions needed to complete one hosted checkout.
4. Please confirm that the callback URLs below are acceptable for hosted checkout testing.

Browser return	https://lab.aithreesixty.tech/api/billing/expresspay/return
Server notification	https://lab.aithreesixty.tech/api/billing/expresspay/notify

Verification already completed

TEST LAYER	RESULT	EVIDENCE
ExpressPay API contract	11 / 11 passed	Submit payload, Query parsing, HTTPS callbacks, amount validation, transaction IDs and fail-closed handling
AI360 payment lifecycle	13 / 13 passed	Idempotency, callback admission, mismatch review, activation, subscription, credits, duplicate suppression and ledger integrity
Full application suite	222 / 222 passed	No regression across the wider application; production compilation also passed
Credentialed sandbox probe	Status 4	Provider reachable; caller IP rejected before hosted checkout creation

Integration safeguards

AI360 uses ExpressPay hosted checkout and does not collect card or wallet credentials. Redirects and notifications are treated as untrusted signals. Before subscription or credit activation, AI360 performs a server-to-server Query and matches the local order, provider token, currency, amount, status and transaction ID. Unknown and replayed callbacks cannot create access or grant credits twice. Customer billing remains disabled pending sandbox completion.
