

# AI360 product and platform update

Prepared for management. Covers the work completed on the AI360 Lab application between 20 and 21 August 2026, and what was verified against the live production environment on the day of writing.

|                                                                                      |                                                                                         |                                                                                     |                                                                                 |

## SUMMARY

Two working days went into three things: giving people a plain-language way into the product (Tools & Kits), letting a workspace carry its own brand into what it produces (Brand Kit), and making it visible to a user when an answer has actually been checked against a current source rather than recalled from training data (answer verification). Alongside this, two data-access gaps were closed and one navigation entry was hidden pending a clearer use case.

Every change below shipped to production. The verification numbers in the band above were measured today, not carried over from an earlier report.

## WHAT SHIPPED

- **Tools & Kits** — the discovery module was renamed from “Market” and organised around 17 real jobs across 11 working project engines.
- **Brand Kit** — a workspace can now store its own knowledge and logo, and documents it generates can carry that identity.
- **Answer verification** — chat now tells the user, per answer, whether a time-sensitive claim was checked against a live source.
- **Data access hardening** — a spend-data permission gap and a missing index on a foreign key were closed.
- **Navigation** — the Library entry was removed from the side menu on 21 August; the module itself is unchanged.

## Tools & Kits replaces Market

The module now describes what a person can actually do today: pick a recognisable job and get a working result. “Market” is set aside for a later, separate idea — a storefront of creator-made tools — so the current label does not promise something that is not built yet.

| Decision                                      | Reason                                                                                                          |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Rename Market → Tools &amp; Kits</b>       | “Market” reads as a storefront. Nothing is bought or sold here yet, so the name was overpromising.              |
| <b>Organise by job, not by category</b>       | A person searching does not think in product categories. “Prepare for an exam” finds faster than “Study tools.” |
| <b>Every listing maps to a working engine</b> | 17 listings resolve to 11 project engines that already run end to end. Nothing on the page is a placeholder.    |
| <b>Keep the audience wide</b>                 | Study, career, creative and business needs sit in one catalogue so the product is not read as business-only.    |

### CATALOGUE COVERAGE

| Audience                  | Coverage                                                                                 |
|---------------------------|------------------------------------------------------------------------------------------|
| <b>Study &amp; school</b> | Exam preparation, assignment research, scholarship support, final-year project planning. |
| <b>Career</b>             | CV and cover letter support, interview preparation, first-90-days planning.              |
| <b>Create</b>             | Portfolio project planning and a month of usable content.                                |
| <b>Business</b>           | Business launch, naming and domain checks, marketing, ads and pitch preparation.         |

### HOW A CHOICE BECOMES A RESULT

## Brand Kit: knowledge and logo

A workspace can now hold its own brand knowledge and logo, and pass both into the documents AI360 generates for it, instead of every export looking generic.

| Decision                                              | Reason                                                                                                                                                                                                                       |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Brand knowledge is workspace-wide, not per project    | A business's voice and facts are true across every conversation, not one project. Scoping it to a project would mean re-entering the same context repeatedly.                                                                |
| Logo reuses the existing private asset storage        | Every generated file already lives in one private bucket. Adding a second storage path for logos only would duplicate infrastructure for no benefit.                                                                         |
| Brand colours are now optional                        | The original brand-kit table required both colours. A workspace that only has a logo and no defined colours was previously an invalid state; it is now a normal one.                                                         |
| Spend data (cost ledger) closed to both browser roles | A prior migration revoked table access from the general "public" role, but Supabase grants browser roles their own separate privileges by default, so the ledger was still reachable. Both roles are now revoked explicitly. |

### WHAT FEEDS A BRANDED EXPORT

A workspace's identity is now separate from any one conversation or project, so a document generated next week still reflects the same organisation.

## Answer verification (“grounding”)

Chat can now tell a user, honestly, whether the current-facts part of an answer was checked against a live source — and it withholds a claim it could not verify rather than presenting a fluent guess as current.

Until this change, any question that looked research-shaped routed into the same metered, multi-source Research workflow used for genuine investigations — whether the person asked “what time is it in Accra” or “compare three market entry strategies with sources.” The two needs are different: one is a short lookup inside an ordinary reply, the other is a paid, multi-source workflow.

| Decision                                               | Reason                                                                                                                                                                             |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Split freshness from deep research                     | A short current fact (a date, a price, a schedule) belongs in an everyday answer. Only an explicitly research-shaped request should enter the metered Research workflow.           |
| Three freshness states: off, auto, required            | “Required” covers mutable claims (prices, laws, current officeholders, availability) where the model must not answer from memory alone.                                            |
| A required-freshness answer is held back if unverified | The reply stays buffered until at least one supporting source is found. If none is found, the user is told the claim could not be verified rather than shown an unverified answer. |
| The check is visible to the user, not just logged      | A receipt line under the answer reads “Checked against current sources” with a date, or flags that sources could not be verified, so the trust signal is not only in server logs.  |

### REQUEST TO RECEIPT

## Smaller fixes, and today's navigation change

Alongside the larger features, three smaller changes shipped: two close access or performance gaps, one is a UI decision made today.

| Change                                              | Reason                                                                                                                                                                                                 |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Index added on brand knowledge owner_id             | That column is a cascading foreign key. Postgres does not index a foreign key automatically, so deleting a user would have scanned the entire knowledge table while holding locks.                     |
| Auth listener no longer forces a full route refresh | Every authentication state change previously triggered a full route refresh. The refresh call was removed from that listener for a steadier session experience.                                        |
| Library removed from the side navigation            | The entry is commented out, not deleted — the Library module and its code are unchanged. It is set aside for now with a clearer use case to define later, so it can be restored without rebuilding it. |

VERIFIED TODAY, 21 AUGUST

| Check                       | Result                                                                        |
|-----------------------------|-------------------------------------------------------------------------------|
| Automated test suite        | 359 of 359 passed                                                             |
| Production build            | Compiled without errors                                                       |
| Live production checks      | 59 of 59 passed (health, readiness, pages, security headers, discovery files) |
| Database migrations         | 22 of 22 applied, through 0022                                                |
| Row-level security          | 37 tables protected                                                           |
| Anonymous role table grants | None                                                                          |

The production environment reflects everything in this report. Nothing described above is staged or pending deployment.
